

Wivenhoe Power Station Data Logger

High Speed Data Logging and Data Storage

Wivenhoe Power Station has two of Australia's largest Kingfisher RTU installations. Part of the system incorporates high-resolution time and date stamped sequence of events recording. This is achieved using hardware that attaches the time and date of occurrence of a digital input change down to 1-millisecond (+/-) resolution.

The logged data is then retrieved from the RTU processor using the Wonderware I/O Server. Logged data and other real time data are ultimately presented back to the HMI for animation and alarms. Data storage is achieved using the Wonderware Industrial SQL Server. High-resolution time and date information is retained using the InSQL Server product.

SOE (Sequence of Events) data is used to determine the order of equipment alarm and status information. Ultimately this is used to enhance fault diagnosis and thus minimize plant down time.
